New honeycomb grid for broncolor P 45, P65 and PAR reflectors

The Swiss lighting specialist is newly offering a honeycomb grid with an especially narrow coverage angle for the light-shapers P 45, P 65 and PAR.

To date, broncolor has had three different honeycomb grids in their assortment for the P 45, P 65, P 70 and PAR reflectors.

The new honeycomb grid (designation: extra narrow) for the P 45, P 65 and the PAR reflectors has an even narrower coverage angle. This creates unlimited spot-like light. There is no outward light spillage which results in a very effective illumination. This new design tool is especially suitable for product and fashion photography, as well as portraiture. Unlike a real spotlight, the light is slightly softer which can be an advantage for people photos. In bright, smaller studios, the honeycomb grid prevents shadows from becoming unintentionally lightened up and contrast, as well as colour saturation from becoming reduced. Generally, they appear to be more natural than squared highlights from softboxes. Additional diffusers allow the light of the new reflector to become even softer.
